

FIBERGLASS REINFORCED PLYWOOD CONSTRUCTION

A straight-truck with three-eighths inch plywood wall construction is rugged enough to provide solid protection from the rigors of heavy use. Wrap the plywood in polyester resin, reinforced with high strength woven fiberglass, and it offers exceptional protection from the elements as well.

Inside and out, FRP Refrigerated bodies deflect moisture, are easy to clean, and maintain a smooth, attractive appearance through years of use.

The FRP Refrigerated Body's floor is fully insulated using poured-in-place polyurethane foam process to ensure consistent density and equal insulation across the entire floor. Thermal breaks at the door and threshold also help to minimize infiltration and maintain an even temperature throughout the cargo area.

RESISTS SCRATCHES AND DENTS

FRP Refrigerated bodies resist the scratches and dents that would mar lesser materials, and detract from the professional appearance you work hard to maintain.

GREAT FOR GRAPHICS

Fiberglass Reinforced Plywood bodies are smooth, unblemished and the perfect canvas for custom graphics that speak to your commitment to quality.

FULLY INSULATED FLOORS, WALLS AND CEILING

Poured-in-place polyurethane foam insulation at the floors, walls and ceilings, sets FRP Refrigerated bodies apart when it comes to maintaining consistent temperatures. By helping to minimize leaks and passive heat transfer that often occurs at seams and joints, and can result in significant temperature differences across the cargo area, Bullex-schwall protects your product AND your bottom-line.

SEAMLESS GLASSBOARD INTERIOR WALLS

Seamless Glassboard interior walls are easy to maintain, and support the clean, professional environment your product requires and your team members appreciate.
